Axis 1: 7.0% of variation beyond age

related to: network density -0.29, age since birth +0.18

One-group model, q = 70. Red = higher in infants scoring high on the axis, blue = lower;
dark grey = tissue outside the 90 AAL regions. Same colour scale for every axis.
Light grey = 95% bootstrap interval includes zero (1000 replicates); B: error bars = 95% intervals.
